

1 **ABSTRACT OF THE DISCLOSURE**

2 An adjusting device for straps of a knapsack is disclosed. The straps
3 each have an upper band provided at an upper end and a lower band provided at a
4 lower end. The adjusting device includes a back board attached to a back surface
5 of the knapsack, the back board having two longitudinal slots parallel to each
6 other. The back board has two openings, of which a width is larger than a width
7 of the sliding blocks, and respectively defined at lower ends of the longitudinal
8 slots. A sliding board is attached to the straps and has multiple sliding blocks
9 movably mounted in the corresponding longitudinal slots. The sliding board has
10 necks, of which a width is smaller than a width of the longitudinal slots, and
11 respectively formed between the sliding blocks and the sliding board and
12 received in the corresponding longitudinal slots.
